

when should you take a covid test?

Being able to quarantine at the first signs of COVID is important to stop the spread. You should take a COVID test if you:

- When in contact with someone that tested COVID positive
- Recently traveled
- Have symptoms such as, fever, sore throat, cough, loss of taste/smell, or difficulty breathing

if you test positive

Isolate yourself by staying in a separate room if you live with other members.

Monitor your symptoms. If you begin to experience emergency warning signs, seek emergency medical attention.

if you test negative

If you test negative, the test did not find the virus in your sample.

You should test again within a few days to ensure you are COVID negative.

if you have questions

Always consult your doctor with questions about your health and check on the CDC website for quick access to resources when dealing with the COVID-19 virus.
